Color is a powerful tool that can evoke emotions, create atmosphere, and communicate information. When used effectively, color combinations can enhance the visual appeal of a design, make it more memorable, and even influence the behavior of users.

But choosing the right colors can be a daunting task. With so many options to choose from, it's easy to get overwhelmed. That's where color theory comes in.

Color Theory Basics

Color theory is the study of how colors interact with each other. It provides a framework for understanding how to create harmonious and visually appealing color combinations.

The Color Wheel

The color wheel is a circular diagram that represents the relationships between colors. It is divided into 12 sections, each representing a different hue. The three primary colors are red, yellow, and blue. The secondary colors are green, orange, and purple. The tertiary colors are created by mixing a primary color with a secondary color.

Color Harmonies

Color harmonies are groups of colors that work well together. There are several different types of color harmonies, each with its own unique look and feel.

Complementary Colors

Complementary colors are colors that are directly opposite each other on the color wheel. They create a high-contrast effect that is both visually striking and attention-grabbing. Examples of complementary color pairs include red and green, blue and orange, and yellow and purple.

Complementary colors: red and green

Analogous Colors

Analogous colors are colors that are adjacent to each other on the color wheel. They create a harmonious and cohesive look that is often found in nature. Examples of analogous color schemes include green, yellow-green, and yellow; blue, blue-green, and green; and red, red-orange, and orange.

Monochromatic Colors

Monochromatic colors are shades of the same color. They create a sophisticated and elegant look that is perfect for creating a sense of unity and cohesion. To create a monochromatic color scheme, simply choose a color from the color wheel and then use different shades, tints, and tones of that color.

Monochromatic colors: black, gray, and white

Triadic Colors

Triadic colors are colors that are evenly spaced around the color wheel. They create a vibrant and energetic look that is perfect for attracting attention. To create a triadic color scheme, choose three colors that are 120 degrees apart on the color wheel.

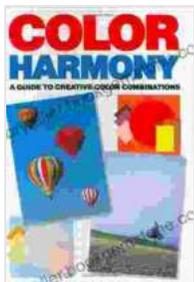

Split-Complementary Colors

Split-complementary colors are a variation of complementary colors. Instead of using two colors that are directly opposite each other on the color wheel, split-complementary color schemes use one color and the two colors adjacent to its complement. This creates a more subtle and nuanced look than traditional complementary color schemes.

Split-complementary colors: red, cyan, and green

Tetradic Colors

Tetradic colors are colors that form a rectangle on the color wheel. They create a dynamic and
